

## mongodb II

Posted April 12th, 2024

mongodb installation woes

Installation on aws 2023 /aws 2

So the general advice on the net is to do:

```
dnf install mongodb-org
```

When you get to mongosh ... you lose...

You'll get an error like:

```
<code>
```

```
[root@groupcorners ~]# mongosh
mongosh: OpenSSL configuration error:
40C88FFB977F0000:error:030000A9:digital envelope routines:alg_module_init:unkno\
wn option:../deps/openssl/openssl/crypto/evp/evp_cnf.c:61:name=rh-allow-sha1-si\
gnatures, value=yes
</code>
```

And its all very sad!

So... to fix this:

```
<code>
```

```
dnf remove mongodb-org
```

```
dnf install mongodb-mongosh-shared-openssl3
```

```
dnf install mongodb-org
```

```
</code>
```

Somehow installing mongodb-org straight gets the wrong version of mongosh installed.

No one likes dependencies.

Now at least mongosh works. Wish I knew where to send this bit so it gets fixed!
